## Methods of Electric Power Systems Analysis

### Lecture 2: Power Systems Overview

---

Prof. Tom Overbye

Dept. of Electrical and Computer Engineering

Texas A&M University

[overbye@tamu.edu](mailto:overbye@tamu.edu)

TEXAS A&M  
UNIVERSITY

# Announcements

---

- Start reading Chapters 1 to 3 from the book (mostly background material)
- We'll be using PowerWorld Simulator fairly extensively in this class, both the educational and professional versions
- Download the free 42 bus educational versions of PowerWorld Simulator at <https://www.powerworld.com/gloveroverbyesarma>

# Electric Frequencies and Residential Voltages Worldwide

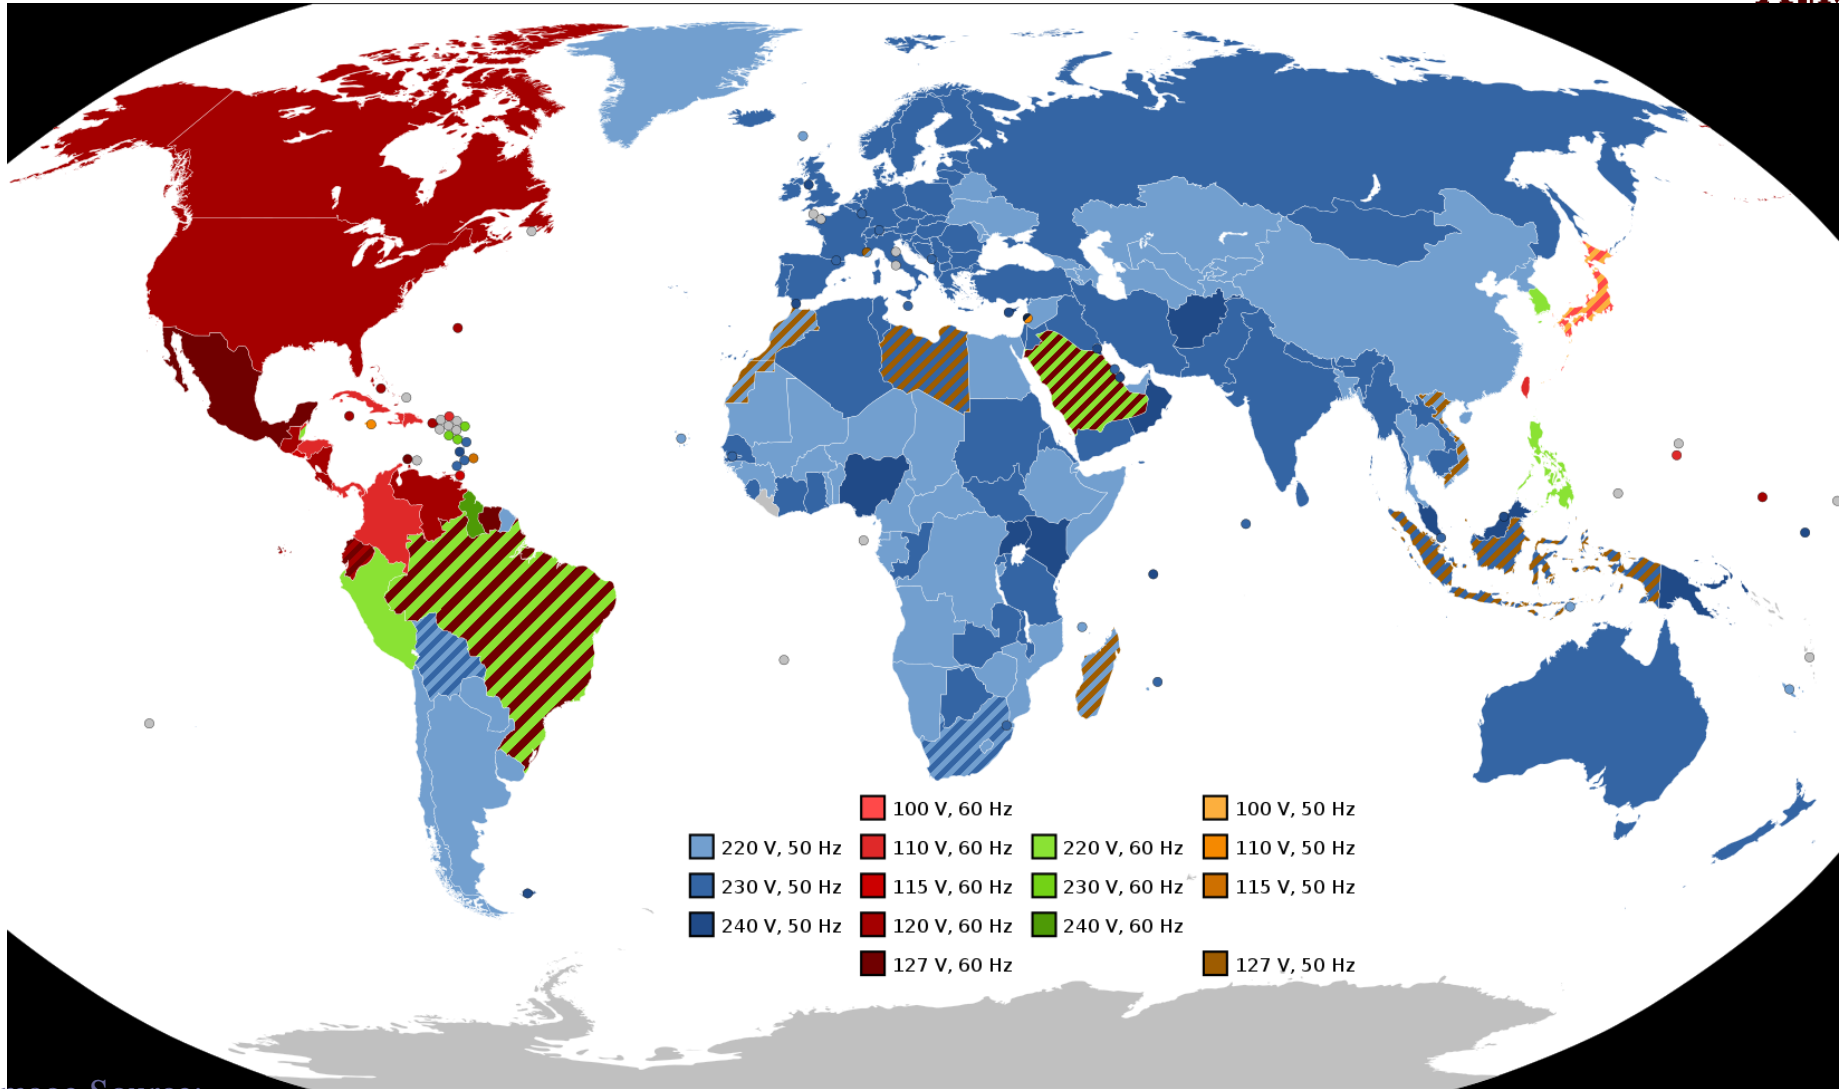

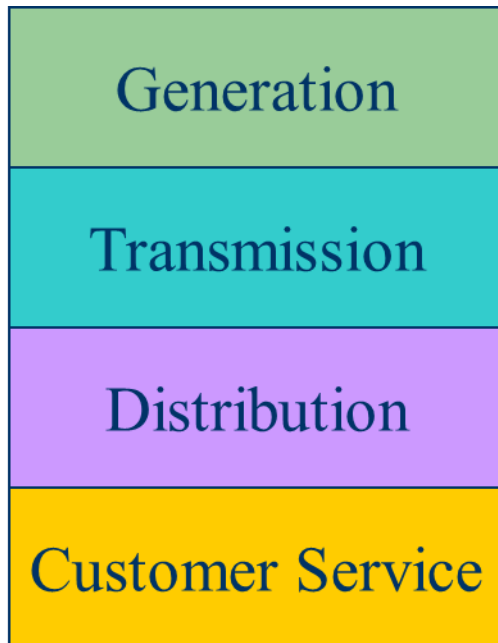

Image Source:

[en.wikipedia.org/wiki/Mains\\_electricity\\_by\\_country#/media/File:World\\_Map\\_of\\_Mains\\_Voltages\\_and\\_Frequencies,\\_Detailed.svg](https://en.wikipedia.org/wiki/Mains_electricity_by_country#/media/File:World_Map_of_Mains_Voltages_and_Frequencies,_Detailed.svg)

# Historical Electric Utility Organization

- Traditionally electric utilities were vertical monopolies; within a particular geographic market, they had an exclusive franchise
  - This has changed in many places around the country

In return for this exclusive franchise, the utility had the obligation to serve all existing and future customers at rates determined jointly by utility and regulators.

# Generation

---

- Large plants have predominated, up to 1500 MW
  - Natural Gas (40%) and coal (21%) are most common sources, followed by nuclear (20%), wind (7.6%), hydro (6.6%), and solar (2.7%)
    - Wood is 1.0%, geothermal 0.4%
- Coal was at least 50% of the total up to 2007
- New construction mostly wind, solar and natural gas (with wind and solar energy costs now quite low)

Sources are by energy (not capacity), 5/2019-4/2020; source US EIA

# US Electricity Generation

**Figure 7.2 Electricity Net Generation**  
(Billion Kilowatthours)

Total (All Sectors), Major Sources, 1949–2019

Source: EIA Monthly Energy Review, July 2020

# US Generator Capacity Additions

U.S. utility-scale electric generating capacity by initial operating year (as of Dec 2016)  
gigawatts

U.S. utility-scale electric capacity additions and retirements (2002-16)  
gigawatts

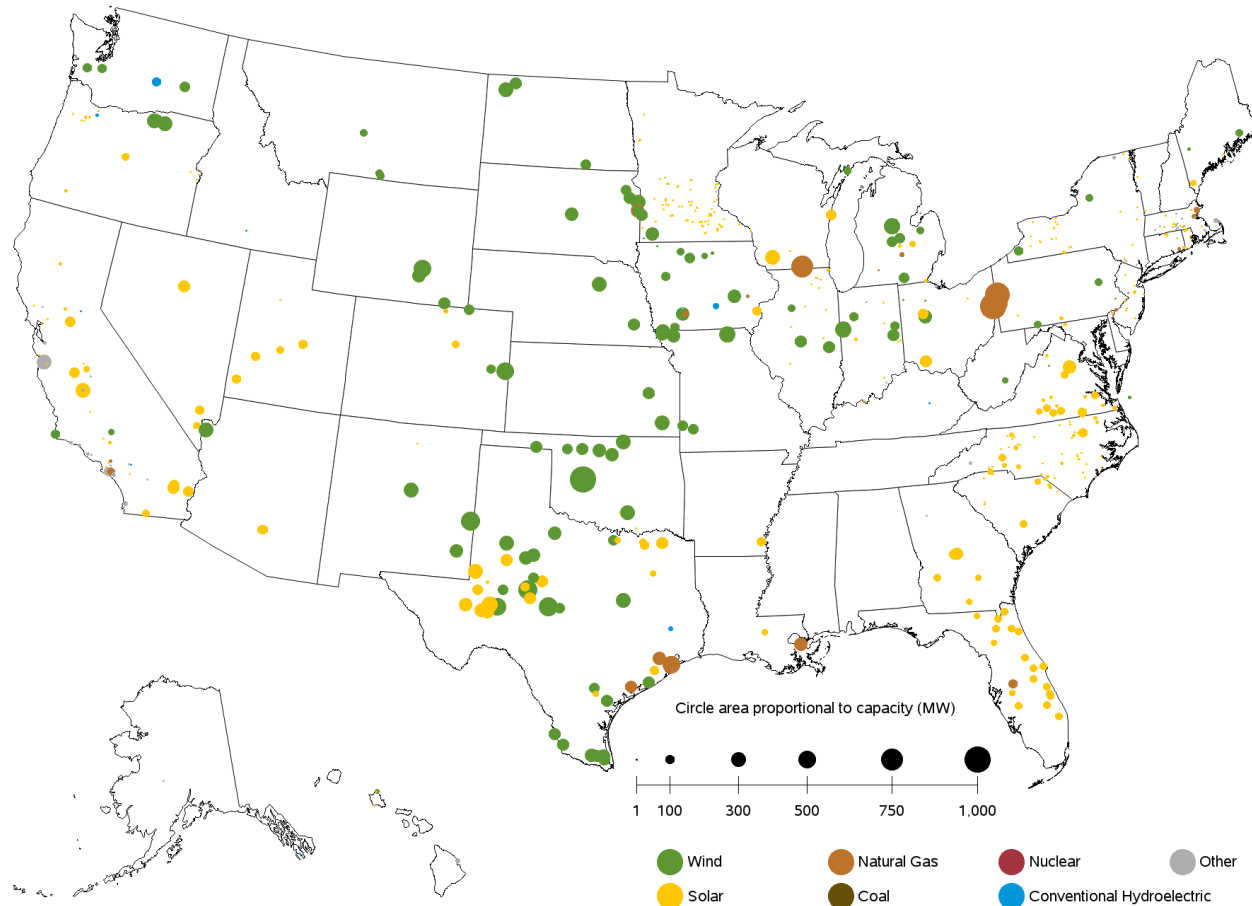

Natural gas and wind generation additions in the last decade dwarfed all other technologies, but with solar rapidly growing. The gas generation, and low natural gas prices were partially responsible for the recent decrease in carbon dioxide emissions

# New Generation May 2020 to April 2021

Figure 6.1.C. Utility-Scale Generating Units Planned to Come Online from May 2020 to April 2021

Sources: U.S. Energy Information Administration, Form EIA-860, 'Annual Electric Generator Report' and Form EIA-860M, 'Monthly Update to the Annual Electric Generator Report.'

Sources: EIA Electricity Monthly, May 2020

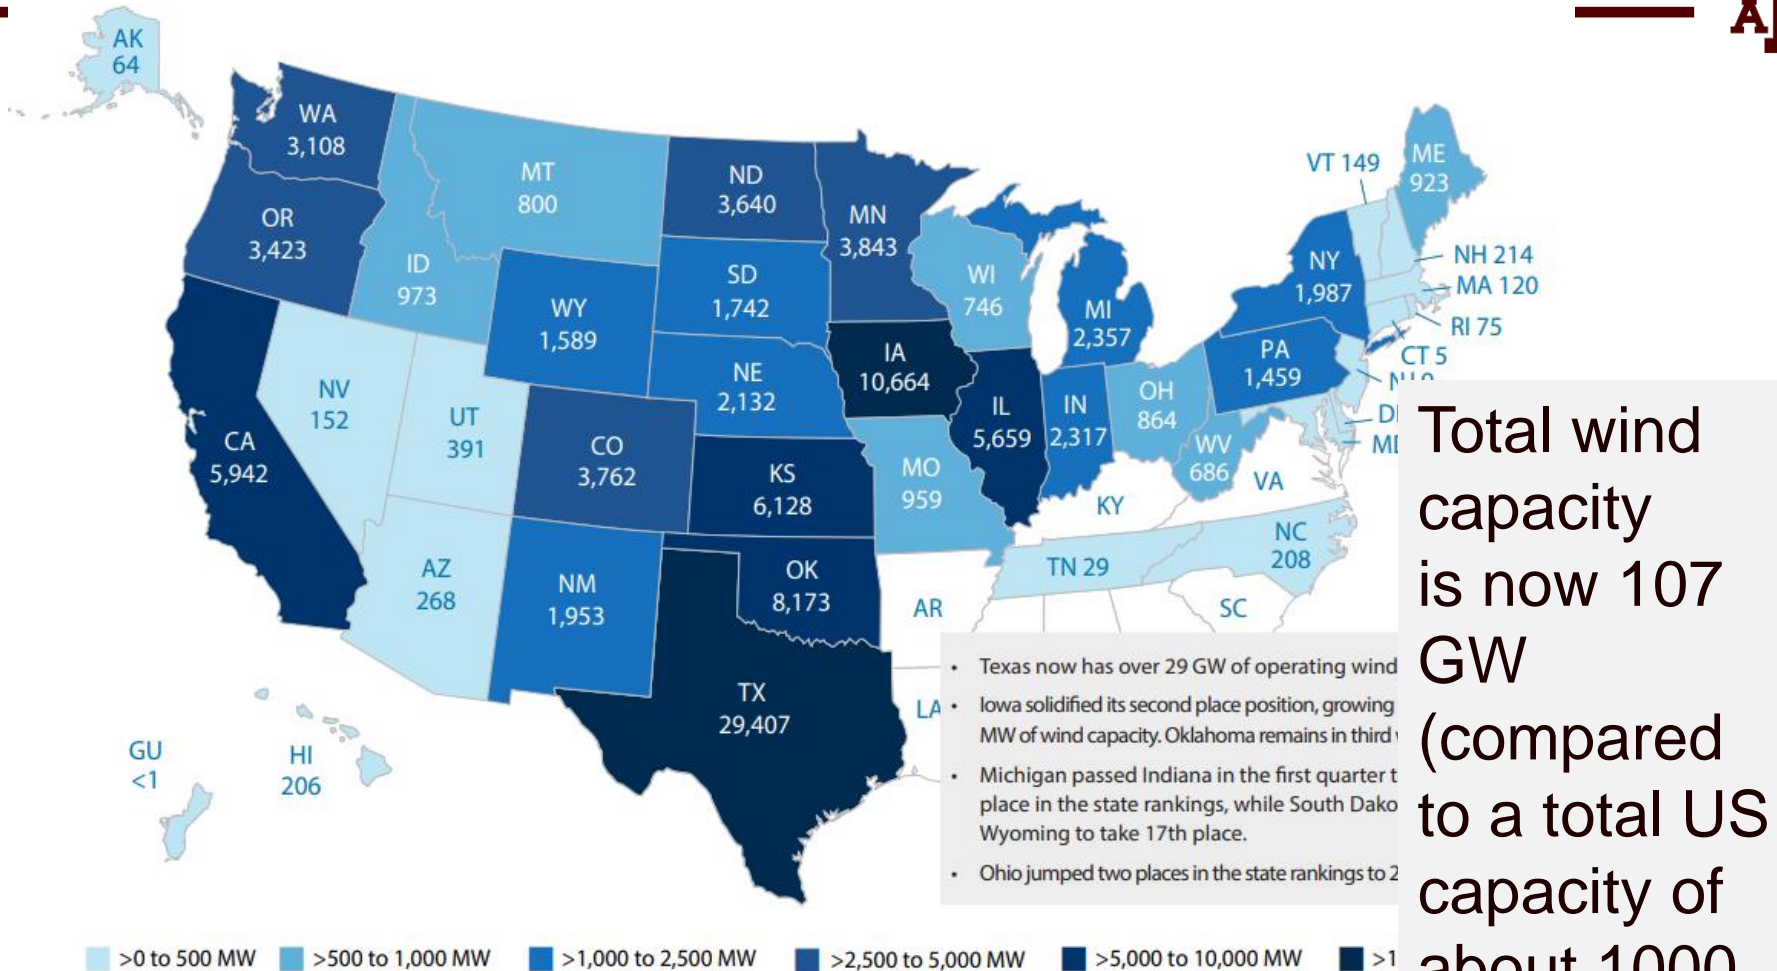

# The World: Energy Consumption by Source

Source: EIA, International Energy Outlook 2018

# US Wind Capacity by State

Total wind capacity is now 107 GW (compared to a total US capacity of about 1000 GW)

Source: AWEA 1st Quarter 2020 Market Report

# Texas Electricity Sources

---

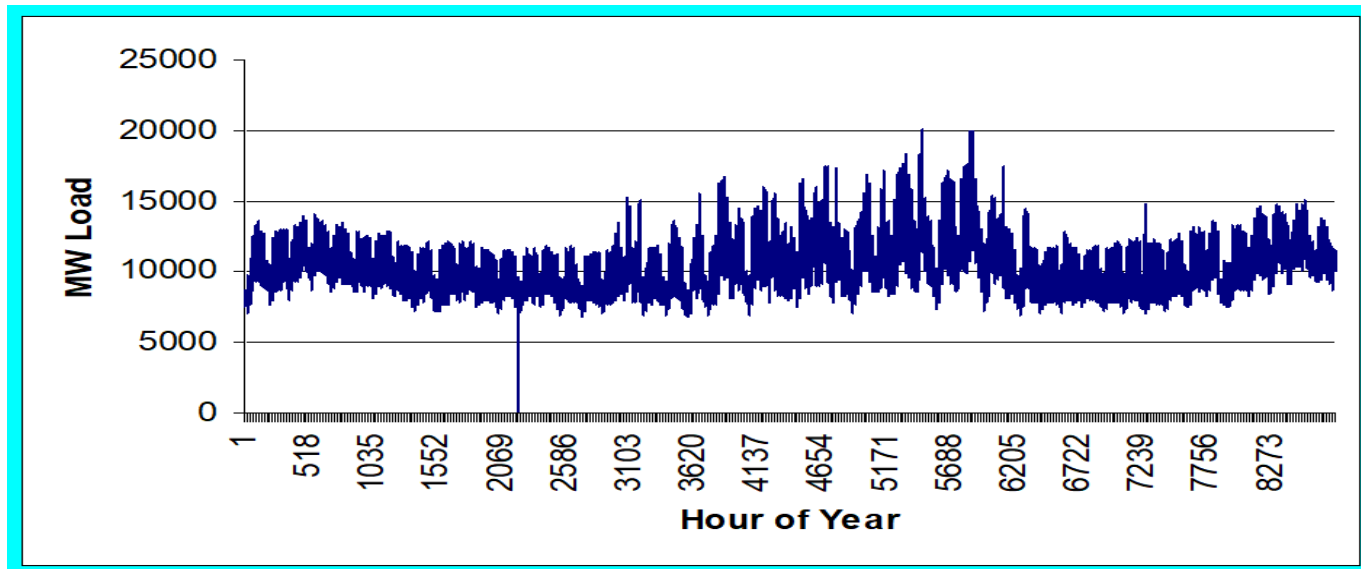

- In 2018 the Texas top five fuel sources for electricity were Natural Gas (50%), Coal (23%), Wind (15.7%), Nuclear (8.7%), Solar (0.6%), other (the rest)
  - **Average retail price is 8.48 cents/kWh**
- In 2018 the California top five fuel sources for electricity were Natural Gas (46%), Solar (13.8%), Hydro (13.5%), Nuclear (9.3%), Wind (7.2%), Geo (5.9%)
  - **Average retail price is 16.58 cents/kWh**
- In 2018 Kentucky was 75% coal, while Washington was 69% hydro; highest retail costs are 29.1 cents/kWh in Hawaii, 19.3 in Alaska and 18.4 in Connecticut

# Loads

- Can range in size from less than one watt to 10's of MW.
- Loads are usually aggregated.
- The aggregate load changes with time, with strong daily, weekly and seasonal cycles.

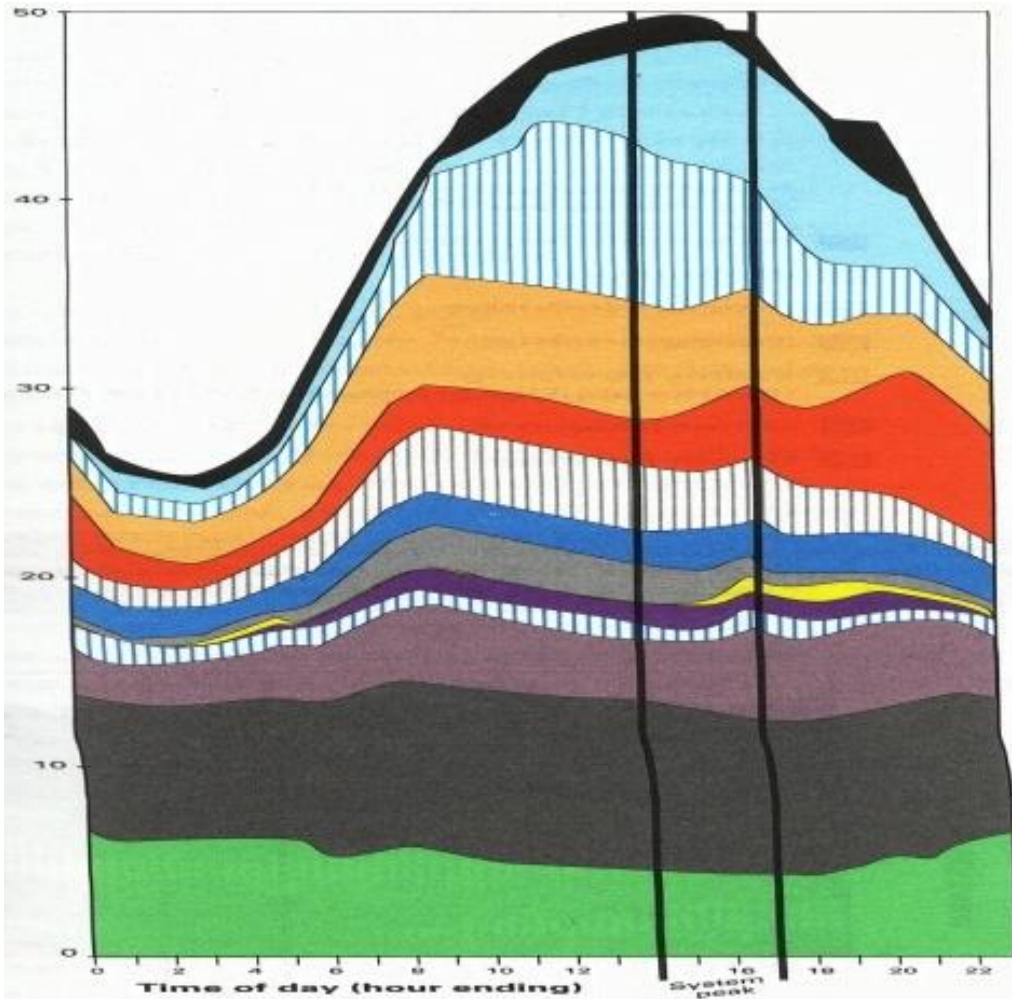

ComEd Yearly Load

# Example: PJM Weekly Summer Load Variation, July 2013

# Example Daily Load Variation: Very Location Specific

- | Commercial                    | Residential        |
|-------------------------------|--------------------|
| Air conditioning              | Air conditioning   |
| Interior lighting             | Miscellaneous      |
| Other                         | Refrigerator       |
| Ventilation                   | Cooking            |
| Refrigeration                 | Clothes dryer      |
| Residual ("other" area)       | Domestic hot water |
| Remainder of buildings sector | Television         |
| Industrial sector             | Freezer            |
| Agriculture & other sector    | Dishwasher         |
|                               | Washer             |

# Transmission and Distribution

---

- Goal is to move electric power from generation to load with low losses.
- Less losses at higher voltages ( $S=VI^*$  and  $I^2R$  losses), but more difficult to insulate.
- Typical high voltage transmission voltages are 765, 500, 345, 230, 161, 138 and 69 kV.
- Lower voltage lines are used for distribution (12.4 or 13.8 kV).
- Typical losses are about 3 to 5% in transmission and 10 to 15% in the distribution system.

# Transmission & Distribution

---

- Transmission
  - networked connections
  - power can be supplied from multiple sources
  - typically higher voltages, above 100 kV
  - mostly overhead, with some underground in urban areas
  - Often source of large-scale blackouts
- Distribution
  - radial connections
  - power moves in one direction only
  - typically lower voltages, below 100 kV
  - the source of most black-outs, but these are local
  - Most new construction is underground, especially in suburban and urban locations

# Three Phase Transmission Line

# Transmission Lines and the Elements

Ike in Beaumont, Tx

Quebec Ice Storm

# Transformers

---

- Transformers provide an easily means for changing ac voltage levels
  - Power flow through transformers is bi-directional
- Heating is a major concern that can quickly lead to loss of transformer life (and occasionally explosions!)
- High voltage transformers (say 230 kV and up) are large, heavy, and difficult to replace

# A 230/115 kV Transformer

# Residential Distribution Transformers

- Residential single phase electric service uses a center tapped transformer to provide 240/120 volt service; a separate ground is used for safety

# Per Unit Calculations

---

- A key problem in analyzing power systems is the large number of transformers.
  - It would be very difficult to continually have to refer impedances to the different sides of the transformers
- This problem is avoided by a normalization of all variables.
- This normalization is known as per unit analysis

$$\text{quantity in per unit} = \frac{\text{actual quantity}}{\text{base value of quantity}}$$

# Components Join Together at a Bus

# Energy Economics

---

- Electric generating technologies involve a tradeoff between fixed costs (costs to build them) and operating costs
  - Nuclear and solar high fixed costs, but low operating costs (though cost of solar has decreased substantially recently)
  - Natural gas/oil have low fixed costs but can have higher operating costs (dependent upon fuel prices)
  - Coal, wind, hydro are in between
- Also the units capacity factor is important to determining ultimate cost of electricity

# Estimated Energy Costs for New Generation, 2019 Edition

**Table 1b. Estimated levelized cost of electricity (unweighted average) for new generation resources entering service in 2023 (2018 \$/MWh)**

| Plant type                           | Capacity factor (%) | Levelized capital cost | Levelized fixed O&M | Levelized variable O&M | Levelized transmission cost | Total system LCOE | Levelized tax credit <sup>1</sup> | Total LCOE including tax credit |
|--------------------------------------|---------------------|------------------------|---------------------|------------------------|-----------------------------|-------------------|-----------------------------------|---------------------------------|
| <b>Dispatchable technologies</b>     |                     |                        |                     |                        |                             |                   |                                   |                                 |
| Coal with 30% CCS <sup>2</sup>       | 85                  | 61.3                   | 9.7                 | 32.2                   | 1.1                         | 104.3             | NA                                | 104.3                           |
| Coal with 90% CCS <sup>2</sup>       | 85                  | 50.2                   | 11.2                | 36.0                   | 1.1                         | 98.6              | NA                                | 98.6                            |
| Conventional CC                      | 87                  | 9.3                    | 1.5                 | 34.4                   | 1.1                         | 46.3              | NA                                | 46.3                            |
| Advanced CC                          | 87                  | 7.3                    | 1.4                 | 31.5                   | 1.1                         | 41.2              | NA                                | 41.2                            |
| Advanced CC with CCS                 | 87                  | 19.4                   | 4.5                 | 42.5                   | 1.1                         | 67.5              | NA                                | 67.5                            |
| Conventional CT                      | 30                  | 28.7                   | 6.9                 | 50.5                   | 3.2                         | 89.3              | NA                                | 89.3                            |
| Advanced CT                          | 30                  | 17.6                   | 2.7                 | 54.2                   | 3.2                         | 77.7              | NA                                | 77.7                            |
| Advanced nuclear                     | 90                  | 53.8                   | 13.1                | 9.5                    | 1.0                         | 77.5              | NA                                | 77.5                            |
| Geothermal                           | 90                  | 26.7                   | 12.9                | 0.0                    | 1.4                         | 41.0              | -2.7                              | 38.3                            |
| Biomass                              | 83                  | 36.3                   | 15.7                | 39.0                   | 1.2                         | 92.2              | NA                                | 92.2                            |
| <b>Non-dispatchable technologies</b> |                     |                        |                     |                        |                             |                   |                                   |                                 |
| Wind, onshore                        | 41                  | 39.8                   | 13.7                | 0.0                    | 2.5                         | 55.9              | -6.1                              | 49.8                            |

| Hydroelectric <sup>5,6</sup>         | 73                        | 28.89                  | 7.64                             | 1.39                   | 1.62                        | 39.54             | <i>NA</i>                         | 39.54                           |

<sup>1</sup>The capacity-weighted average is the average levelized cost per technology, weighted by the new capacity coming online in each region. The capacity additions for each region are based on additions from 2023 to 2025. Technologies for which capacity additions are not expected do not have a capacity-weighted average and are marked as *NB*, or not built.

<sup>2</sup>O&M = operations and maintenance.

<sup>3</sup>The tax credit component is based on targeted federal tax credits such as the production tax credit (PTC) or investment tax credit (ITC) available for some technologies. It reflects tax credits available only for plants entering service in 2025 and the substantial phaseout of both the PTC and ITC as scheduled under current law. Technologies not eligible for PTC or ITC are indicated as *NA*, or not available. The results are based on a regional model, and state or local incentives are not included in LCOE calculations. See text box on page 2 for details on how the tax credits are represented in the model.

<sup>4</sup>Costs are expressed in terms of net AC (alternating current) power available to the grid for the installed capacity.

<sup>5</sup>As modeled, EIA assumes that hydroelectric generation has seasonal storage so that it can be dispatched within a season, but overall operation is limited by resources available by site and season.

<sup>6</sup>Costs are for 2023 online year. See page 6 for details on the exception.

# Natural Gas Prices 1997 to 2020

## Henry Hub Natural Gas Spot Price

DOWNLOAD

Dollars per Million Btu

Marginal cost for natural gas fired electricity price in \$/MWh is about 7-10 times gas price; Henry Hub is a gas pipeline located in Erath, Louisiana.

# Coal Prices had Fallen But Are Now Back to Values from Five Years Ago

Coal markets archive

Dollars per short ton

Dollars per mmbtu

Current prices are about the same as in Sept. 2017

Historic coal prices by region, 2011-2016

BTU content per pound varies between about 8000 and 15,000 Btu/lb, giving costs of around \$1 to 2/Mbtu

Source: [eia.gov/coal](http://eia.gov/coal)

# Average Cost of Solar Systems, 2019

Average cost of solar panels based on system size

| SYSTEM SIZE | AVERAGE SOLAR PANEL SYSTEM COST (BEFORE TAX CREDITS) | AVERAGE SOLAR PANEL SYSTEM COST (AFTER TAX CREDITS) |
|-------------|--|---|
| 2 kW        | \$5,960  | \$4,172   |
| 3 kW        | \$8,940  | \$6,258   |
| 4 kW        | \$11,920   | \$8,344   |
| 5 kW        | \$14,900   | \$10,430  |
| 6 kW        | \$17,880   | \$12,516  |
| 7 kW        | \$20,860   | \$14,602  |
| 8 kW        | \$23,840   | \$16,688  |
| 10 kW       | \$29,800   | \$20,860  |
| 12 kW       | \$35,760   | \$25,032  |
| 15 kW       | \$44,700   | \$31,290  |
| 20 kW       | \$59,600   | \$41,720  |
| 25 kW       | \$74,500   | \$52,150  |

For the cost for a 10 kW system is \$2.98 per watt before the tax credit and \$ 20.86 after

These prices reflect the cost of a solar energy system both *before AND after* deducting the federal **solar tax credit** (known as the ITC), which reduces your solar system cost by 30 percent. Some states, local governments, and utilities also offer rebates and other tax incentives that can further reduce the solar system costs in your quotes from solar installers.

# Brief History of Electric Power

---

- First real practical uses of electricity began with the telegraph (1860's) and then arc lighting in the 1870's
- Early 1880's – Edison introduced Pearl Street dc system in Manhattan supplying 59 customers
- 1884 – Sprague produces practical dc motor
- 1885 – invention of transformer
- Mid 1880's – Westinghouse/Tesla introduce rival ac system
- Late 1880's – Tesla invents ac induction motor
- 1893 – Three-phase transmission line at 2.3 kV

# History, cont'd

---

- 1896 – ac lines deliver electricity from hydro generation at Niagara Falls to Buffalo, 20 miles away; also 30kV line in Germany
- Early 1900's – Private utilities supply all customers in area (city); recognized as a natural monopoly; states step in to begin regulation
- By 1920's – Large interstate holding companies control most electricity systems

# History, cont'd

---

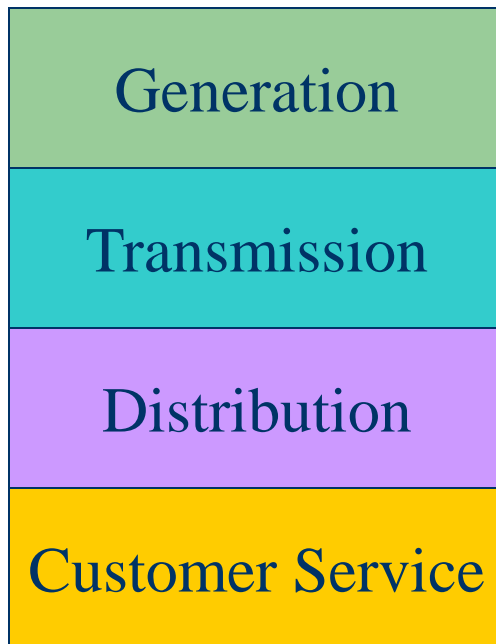

- 1935 – Congress passes Public Utility Holding Company Act to establish national regulation, breaking up large interstate utilities (repealed 2005)
  - This gave rise to electric utilities that only operated in one state
- 1935/6 – Rural Electrification Act brought electricity to rural areas
- 1930's – Electric utilities established as vertical monopolies
- Frequency standardized in the 1930's

# Vertical Monopolies

- Within a particular geographic market, the electric utility had an exclusive franchise

In return for this exclusive franchise, the utility had the obligation to serve all existing and future customers at rates determined jointly by utility and regulators

It was a “cost plus” business

# Vertical Monopolies

---

- Within its service territory each utility was the only game in town
- Neighboring utilities functioned more as colleagues than competitors
- Utilities gradually interconnected their systems so by 1970 transmission lines crisscrossed North America, with voltages up to 765 kV
- Economies of scale keep resulted in decreasing rates, so most every one was happy

# History, cont'd -- 1970's

---

- 1970's brought inflation, increased fossil-fuel prices, calls for conservation and growing environmental concerns
- Increasing rates replaced decreasing ones
- As a result, U.S. Congress passed Public Utilities Regulator Policies Act (PURPA) in 1978, which mandated utilities must purchase power from independent generators located in their service territory (modified 2005)
- PURPA introduced some competition

# History, cont'd – 1990's & 2000's

---

- Major opening of industry to competition occurred as a result of National Energy Policy Act of 1992
- This act mandated that utilities provide “nondiscriminatory” access to the high voltage transmission
- Goal was to set up true competition in generation
- Result over the last few years has been a dramatic restructuring of electric utility industry (for better or worse!)
- Energy Bill 2005 repealed PUHCA; modified PURPA

# Electricity Prices, 1960-2014

U.S. residential retail electricity price (1960-2014)  
cents per kilowatthour

Source: EIA

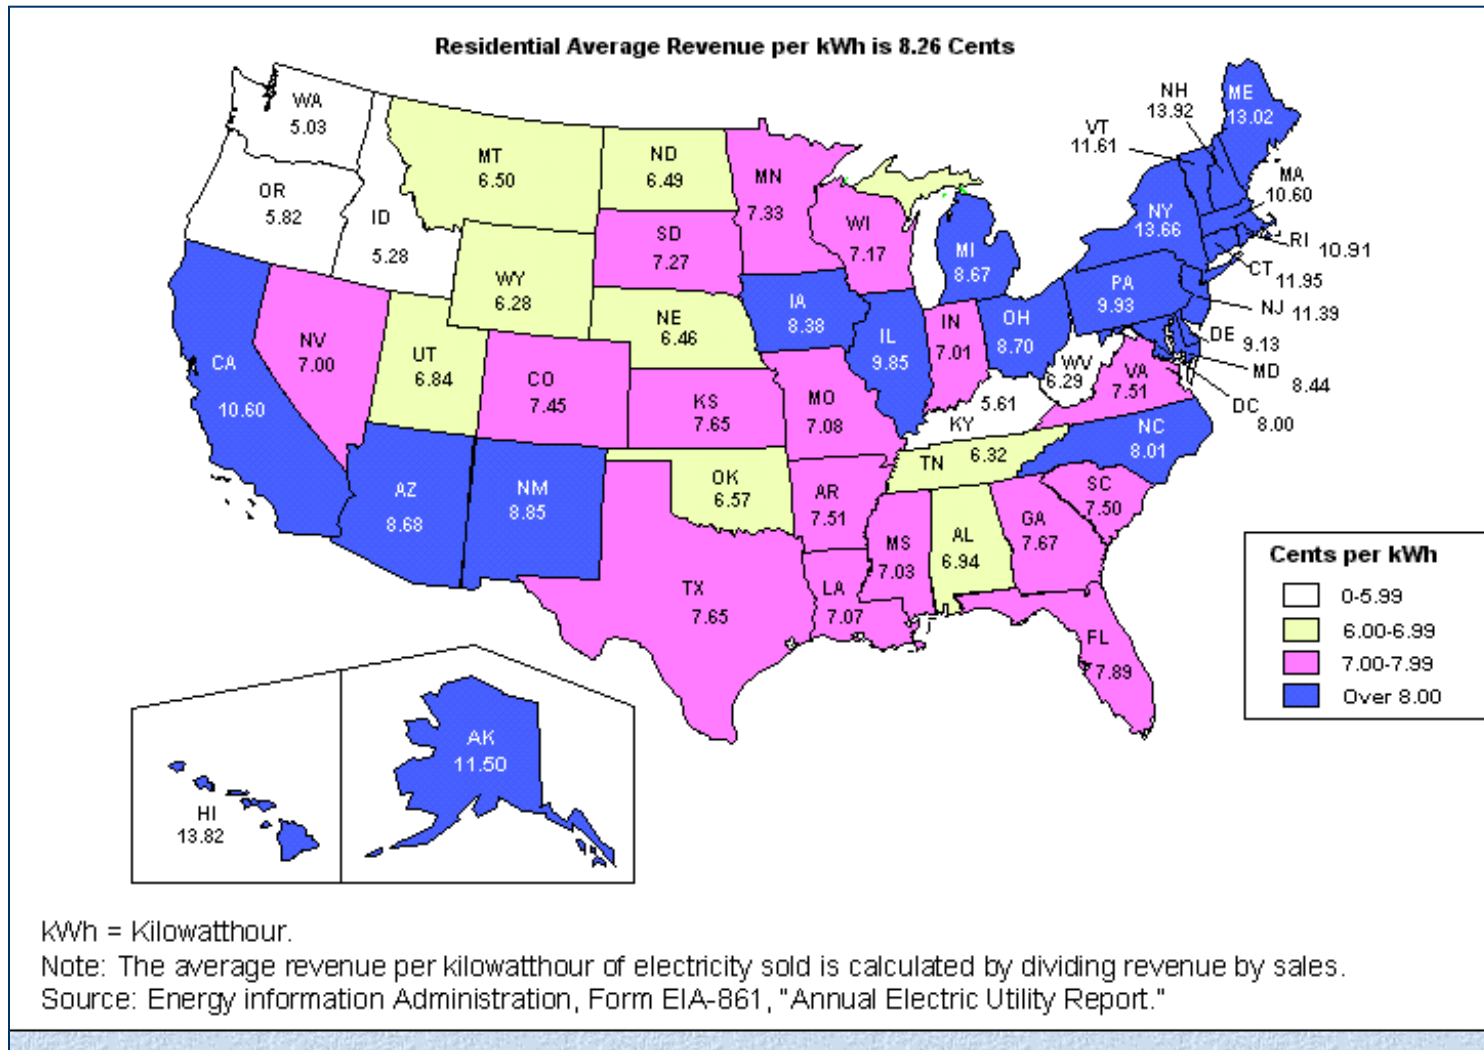

# Utility Restructuring

---

- Driven by significant regional variations in electric rates
- Goal of competition is to reduce rates through the introduction of competition
- Eventual goal is to allow consumers to choose their electricity supplier

# State Variation in Electric Rates

# The Rise of Natural Gas Generation

U.S. utility-scale electric generating capacity by initial operating year (as of Dec 2016)  
gigawatts

# The Smart Grid

---

- The term “Smart Grid” dates officially to the 2007 “Energy Independence and Security Act”, Title 13 (“Smart Grid”)
  - Use of digital information and control techniques
  - Dynamic grid optimization with cyber-security
  - Deployment of distributed resources including
  - Customer participation and smart appliances
  - Integration of storage including PHEVs
  - Development of interoperability standards

# Smart Grid Perceptions (Some of Us Like the Term “Smarter”)

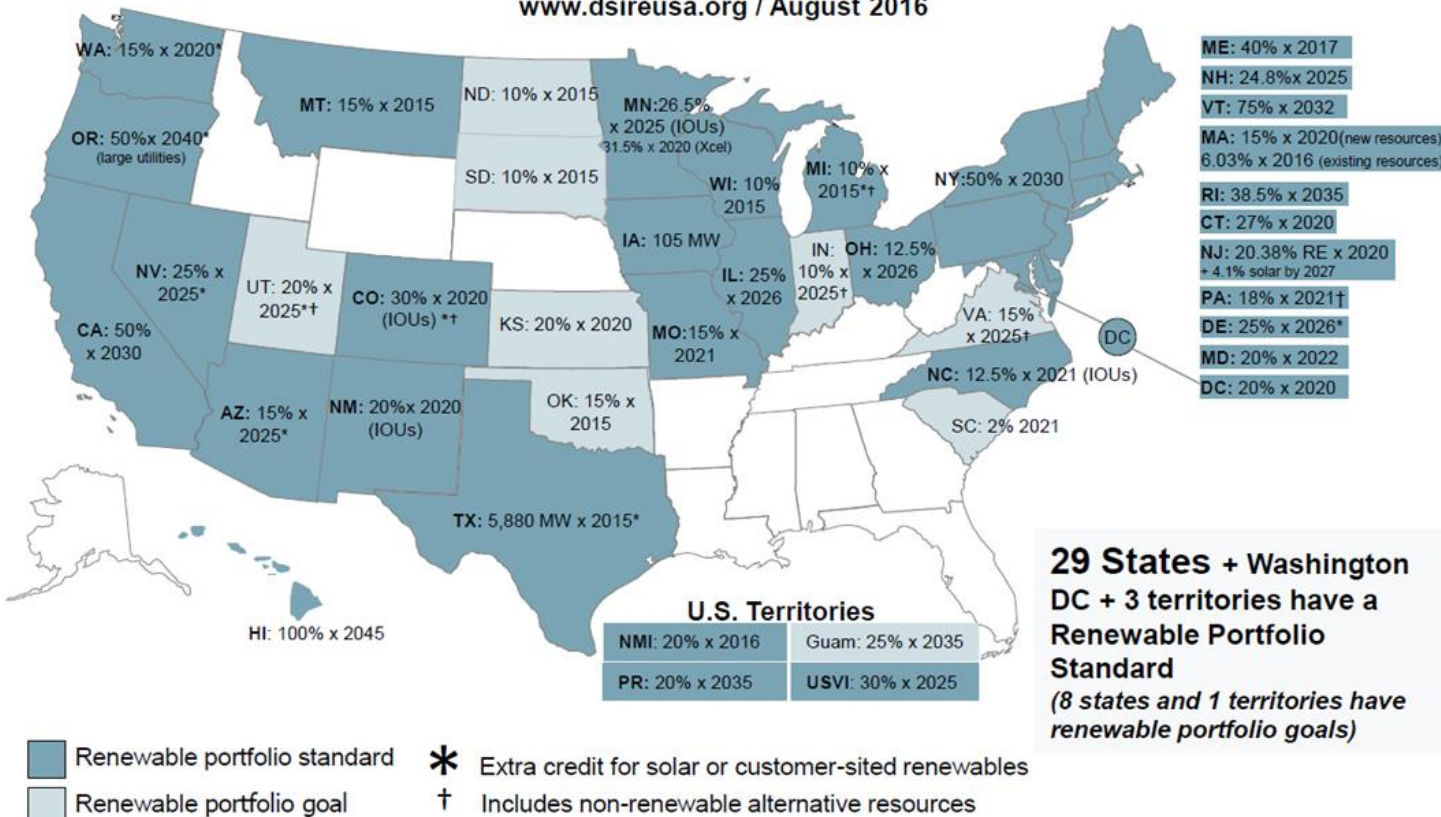

# Renewable Portfolio Standards (August 2016)

## Renewable Portfolio Standard Policies

www.dsireusa.org / August 2016

TX is now 10 GW by 2025 which we've met (i.e., 29 GW of wind now); CA is 60% by 2030 and 100% by 2045

**29 States + Washington DC + 3 territories have a Renewable Portfolio Standard (8 states and 1 territories have renewable portfolio goals)**

Image source: <http://www.dsireusa.org/>

# Slowing Electric Load Growth

Retail Sales [a] by Sector, 1949–2018

Retail Sales [a] by Sector, Monthly

Retail Sales [a] Total, January–April

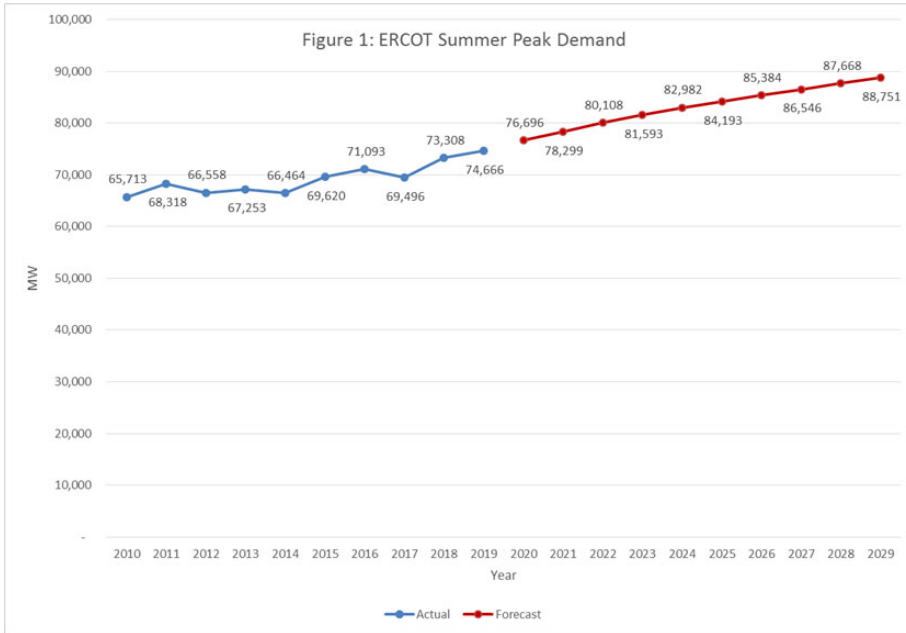

[a] Electricity retail sales to ultimate customers reported by utilities and other energy service providers.  
 [b] See "Direct Use" in Glossary.  
 [c] Commercial sector, including public street and highway lighting, inter-

departmental sales, and other sales to public authorities.  
 [d] Transportation sector, including sales to railroads and railways.  
 Web Page: <http://www.eia.gov/totalenergy/data/monthly/#electricity>.  
 Source: Table 7.6.

Much of the slowing load growth is due to distributed generation, such as solar PV, which sits on the customer side of the meter

# Except in Texas!

The left graph is peak demand, the right energy

ERCOT set a new peak electric load of 74.5 GW on 8/12/19, surpassing the 73.3 GW record from 2018; total energy in 2017 was 357 billion kWh

Source: [www.ercot.com/gridinfo/load/forecast](http://www.ercot.com/gridinfo/load/forecast)

# Interconnected Power System

## Basic Characteristics

---

- Three – phase AC systems:
  - generation and transmission equipment is usually three phase
  - industrial loads are three phase
  - residential and commercial loads are single phase and distributed equally among the phases; consequently, a balanced three – phase system results
- Synchronous machines generate electricity
  - Exceptions: some wind is induction generators; solar PV
- Interconnection transmits power over a wider region with subsystems operating at different voltage levels
